**SunModo PV Rack Mount System**

**UL2703 Compliant**
Please read carefully before installing

Product is tested to and recognized to UL 2703 standards for safety grounding and bonding equipment and meets UL1703 fire standards.

SunModo PV Rack Mount System can be used to mount photovoltaic (PV) panels in a wide variety of locations. All installations shall be in accordance with NEC requirements in the USA. The self-bonding system is for use with PV modules that have a maximum series fuse rating of 30A. Mechanical design loads per UL 2703: Downward Pressure: 33.42 psf (1600.2 Pa), Upward Pressure: 33.42 psf (1600.2 Pa), Down-Slope: 5 psf (239.4 Pa). Mechanical test loads per LTR AE 2012: Downward Pressure: 50.125 psf (2400 Pa), Upward Pressure: 50.125 psf (2400 Pa).

## Installer Responsibility:

Before ordering and installing materials, all system layout dimensions should be confirmed by field measurements. SunModo reserves the right to alter, without notice, any details, proposals or plans. Any inquiries that you may have concerning installation of the PV system should be directed to your SunModo Sales representative. Consult SunModo Sales for any information not contained in this manual. This manual is intended to be used as a guide when installing SunModo’s EZ Tile Hook Mount System on pitched roofs. It is the responsibility of the installer to ensure the safe installation of this product as outline herein.

- Installer shall employ only SunModo products detail herein. The use of non SunModo components can void the warranty and cancel the letters of UL compliance.
- Installer shall guarantee that screws and anchors have adequate pullout strength and shear capacities.
- Installer shall adhere to the torque values specified in this Instruction Manual.
- Installer shall use anti-seize compound, such as Permatex anti-seize, lubricant is recommended for all threaded parts.
- Installer is responsible to install solar panels over a Fire Resistant roof covering rated for the application.
- Installer is responsible to determine that the roof, its rafters, connections, and other architectural support components can sustain the array under all code level loading conditions.
- Installer shall adhere to all relevant local or national building codes. This takes account of those that supplant this document’s requirements.
- Installer shall guarantee the safe placement of all electrical details of the PV array.
- Installer shall comply with all applicable local, state and national building codes, including periodic re-inspection of the installation for loose components, loose fasteners and any corrosion, such that if found, the affected components are to be immediately replaced.
- Installer to ensure the structural support members or footings for mounting the array can withstand all code loading conditions. Consult with licensed professional engineer for the appropriate loading conditions.
- Installer to follow all regional safety requirements during installation.
- This racking system may be used to ground and/or mount a PV module complying with UL 1703 only when the specific module has been evaluated for grounding and/or mounting in compliance with the included instructions.
- Installer shall ensure bare copper grounding wire does not contact aluminum and zinc-plated steel components to prevent risk of galvanic corrosion.
- If loose components or loose fasteners are found during periodic inspection, re-tighten immediately. If corrosion is found, replace affected components immediately.

## Safety:

Review relevant OSHA and other safety standards before following these instructions. The installation of solar PV systems is a dangerous procedure and should be supervised by trained and experienced personnel.

It is not possible for SunModo to be aware of all the possible job site situations that could cause an unsafe condition to exist. The installer of the roof system is responsible for reading these instructions and determining the safest way to install the roof system. These instructions are provided only as a guide to show a knowledgeable, trained erector the correct part placement one to another. If following any of the installation steps would endanger a worker, the erector should stop work and decide upon a corrective action. Provide required safety railing, netting, or safety lines for crew members working on the roof.

SunModo Self-bonding system

SunModo developed a proprietary grounding and bonding system that is built into the mounting hardware for the rails, clamps and splices. We provide further bonding through all the SunTurf racking components including the Pipe Caps, Beams, Posts and Post Base Plates. All hardware meet UL 2703 Grounding and Fire Standards tested by ETL.

The basis of the system is our patented stainless steel floating grounding pin which is designed to be captive in the mounting components and provides a bonding path from the PV panel frames to the rails and rail splices, and finally to the ground lug. The self-bonding system is for use with PV modules that have a maximum series fuse rating of 30A. The maximum number of PV modules is limited by the system voltage, so if a system has multiple inverters, the SunModo racking system can theoretically go on forever.

Finally, we have added a spring and a threadlocker to our Mid Clamp assemblies. The spring keeps the Mid Clamp in the open position ready to receive the solar module. The threadlocker is a light bonding agent allowing the T-Bolt engagement into the Rail when the Collar Nut is turned from above. The threadlocker has the added benefit of being an anti-seize agent for stainless steel hardware in the area where it is applied. For additional anti-seize protection refer to the ‘Tools Required for Installation’ section of this document.

Similarly, the rail splices the grounding pins, eliminating the need for extra bonding components.

2. Grounding Mid Clamp Kit
3. Helio Rail HR150, HR250, HR350 and/or HR500
4. Grounding Lug

Fault Current Path
EZ Tile Hook Mount Series:
SunModo offer 4 choices of tile hooks for vertical rail orientations and 4 hooks for flat mounting for strut type rails. The hook provide a nominal 110 pound load and uplift capability when mounted into roof trusses with two lag bolts. Another feature of the tile hook is the tile hook base, a gasket underneath the hook. The EZ Tile Hook Mounts includes Roof Hook with EPDM Hook Base Gasket (attached) and two 1/4 x 3-1/2” Lag Bolts with Sealing Washers.

The HR150 family of products are shown assembled above. Two HR150 Rails are spliced together with an HR150 Rail Splice. PV electrical wires are shown routed in the channels of the HR150 Rails, retained with two HR150 Channel Clips snapped into place.
Tools Required for Installation

Electric Drill or Impact Driver.  
*Note that the use of an impact driver is strongly discouraged for all stainless nut and bolt hardware.*

---

Roofing Bar

---

Drill Bit for lag bolts, pilot hole 7/32" diameter for 5/16" lag bolt

---

3/8" Socket wrench

---

Sockets for 3/8" drive sockets, 7/16", 1/2", 9/16" and 1-1/16"

---

Torque Wrench 3/8" drive, 0 to 35 ft. lbs.

---

Anti-seize compound (Permatex 80071 or equivalent).

---

Caulk gun and silicon sealant
  - ChemLink M1 (or equivalent) for wood and composite roofs.
  - ChemLink DuraLink (or equivalent) for metal roofs.
Tape measure

Saws for cutting aluminum posts and rails as necessary
Torque Values:
These values must be adhered to for mechanical strength. It is required that a torque wrench be used to measure the bolt torque during final assembly, and it is recommended that anti-seize compound, such as Permatex, be applied to the screw threads.

</tbody>
</table>
Installation Instructions:

Step 1: Attaching
1. Using a roofing bar, gently remove the tile from the desired location gaining access to the interior of the roof. Locate and mark the center of the rafter.
2. Rest the base of the EZ Tile Hook over the center of the rafter and mark center of holes. Drill two 11/64” pilot holes in accordance with the NDS guidelines.
3. Clean away any roof debris and fill the two pilot holes with structural sealant, ChemLink M1 or equivalent.
4. Attach the EZ Tile Hook using the two 1/4 x 3-1/2” Lag Bolts with Sealing Washers, torque to 12ft-lbs.

Step 2: Waterproofing (Materials not provided)
5. Because of the EPDM gaskets design, separate flashing is NOT required.
6. If your local code agency requires a secondary waterproof flashing proceed with waterproofing using three-course method or lapped paper method.
7. For additional waterproofing install a long strip of EPDM foam gasket between the EZ Tile Hook and the top edge of the lower tile. Place a short strip of EPDM foam gasket on top of the EZ Tile Hook to insure water does not travel up the hook and onto the underlayment of the roof.

Step 3: Finishing
8. To ensure the tile sits flush with the roof it may be necessary to notch the bottom of the tile to make space for the raised EZ Tile Hook.
9. Reinstall the tile.

Step 4: L-Foot Assembly
10. Attach an L-Foot to the EZ Tile Hook using a 3/8” Bolt and Flange Nut, torque to 15ft-lbs.

Step 5: Rail Assembly
11. Install AL Rail to L-Foot then tighten 3/8” Flange Nut to 15 ft-lbs. torque.
Portrait Panel Configuration:
With a full range of components the Pitch Roof System can be configured in an endless variety of designs. The system is IBC compliant for roof waterproofing tested by IAPMO, UL 1703 compliant for Class-A Fire Rated for Type 1 and 2 PV Modules and UL 2703 compliant for electrical bonding tested by ETL.

Proceed with the mounting of the PV panels using the Mid and End Clamps. Specific mounting instructions are shown in the following sections for portrait mounting.

A typical portrait roof layout features two East-West rails mounted to North-South roof rafters with an L-Foot. Mid Clamps are used between PV panels, they will produce 1/2” spacing between PV panel frames. End Clamps are used to secure PV panels at the ends of a row.
**Minimum Panel Height**

Minimum leading edge height to meet a UL1703 PV module fire standard is 3 inches.

![3 inch minimum from bottom of PV module frame to the roof covering](image)

**End Clamp Attachment**

- There must be a minimum of 1.5 inches of Rail extending beyond the PV panel frame.
- Clamp the PV panel frame by inserting the T-Bolt into the Rail slot. Position the End Clamp firmly against the PV panel frame and secure using the 1/4-20 Collar Bolt. Using a 7/16” socket, torque to 7.5 ft. lbs.
- Note: When two or more PV panels are installed grounding via the End Clamp is optional. For a single panel configuration (shown), insert the T-Bolt into a T-Bolt Holder for grounding the panel to the Rails.

**Mid Clamp Attachment**

- Insert the T-Bolt in the Rail slot and turn clockwise 90° to engage the head into the slot. Insert Grounding T-Bolt Holder to lock T-Bolt in place.
- Thread the 1/4-20 Collar Bolt onto the top of the T-Bolt as shown. After positioning the Mid Clamp firmly against the PV panel frame, using a 7/16” socket, tighten to 7.5 ft. lbs.
**Landscape Panel Configuration:**
The Pitched Roof System conveniently accommodates landscape configurations to minimize roof time and parts required. The system is IBC compliant for roof waterproofing tested by IAPMO, UL 1703 compliant for Class-A Fire Rated for Type 1 and 2 PV Modules and UL 2703 compliant for electrical bonding tested by ETL.

Proceed with the mounting of the PV panels using the Mid and End Clamps. Specific mounting instructions are shown in the following section for landscape mounting. Mid Clamps are used between PV panels, they will produce 1/2” spacing between PV panel frames. End Clamps are used to secure PV panels at the ends of a row. Note that the PV panels are clamped on the long edges as required by most manufacturers.
Minimum Panel Height

Minimum leading edge height to meet a UL1703 PV module fire standard is 3 inches. 

End Clamp Attachment

End Clamps are used at the ends of a row of PV panels.

Insert the T-Bolt in the Rail slot and turn clockwise 90° to engage the head into the slot. Insert Grounding T-Bolt Holder to lock T-Bolt in place.

Thread the 1/4” Collar Bolt onto the top of the T-Bolt as shown. After positioning the End Clamp firmly against the PV panel frame, using a 7/16” socket, tighten to 7.5 ft. lbs.

Mid Clamp Attachment

Insert the T-Bolt in the Rail slot and turn clockwise 90° to engage the head into the slot. Insert Grounding T-Bolt Holder to lock T-Bolt in place.

Thread the 1/4” Collar Bolt onto the top of the T-Bolt as shown. After positioning the Mid Clamp firmly against the PV panel frame, using a 7/16” socket, tighten to 7.5 ft. lbs.
Ground Wire Attachment

The picture shows a grounding lug mounted on one Rail per row of panels, and a #6 solid copper grounding wire connecting the Ground Lugs to the building ground per NEC 690.47.

Ground Lug Installation

One Rail per row of panels should have a Ground Lug for fastening the ground conductor to the array. The Ground Lug is mounted on the top or side of the Rail using a special 1/4" T-Bolt, Grounding Spacer, and Flange Nut. Grounding Lugs K10179-001, and detailed installation document D10003 are available from SunModo separately.

Rail End Covers

Rail End Covers can be attached to the mounting rails as shown. Rail End Covers are also available for the SunBeam Rail not shown.
UL 2703 Label Placement

When requested the UL 2703 Label can be located on East-West running Rail or Rail Splice.
